

OFFICIAL PROJECT IDENTITY

YearRing Fund Protocol

A non-custodial capital container
for long-term on-chain users.

YearRing starts with conservative DeFi yield and transparent on-chain accounting, then expands toward RWA strategies for users seeking long-term, structured asset exposure.

Non-custodial at the vault/accounting layer: users hold vault shares and exits are rule-based, while strategy and emergency controls are bounded by transparent on-chain permissions.

DEPLOYED ON BASE MAINNET TRANSPARENT ON-CHAIN ACCOUNTING LOCK-UP BASED USER ALIGNMENT

PROJECT SURFACE

Official project entry points only.

THE PROBLEM

DeFi opened access to yield. RWAs are bringing better assets on-chain. Users still lack a long-term capital container.

Users can access yield, but they still lack a structure that makes capital understandable, governable, and durable — with clear accounting, reserve policy, redemption logic, and long-term alignment.

WHAT THE MARKET STILL LEAVES UNRESOLVED

- Crypto still rewards short-term rotation.
- Traditional products remain opaque on liquidity.
- Managers lack a durable capital signal.

WHY THIS MATTERS

- Users need more than yield access.
- Managers need capital with duration.
- RWA issuers need legible, patient capital.

THE INSIGHT

Keep the capital layer clean. Make commitment programmable.

YearRing separates base yield from long-term coordination: the vault keeps accounting, reserves, and redemptions clean, while lockups, rewards, access, and future governance sit above it.

ONE SYSTEM. TWO CONNECTED LAYERS.

Capital Layer

- ERC-4626 USDC vault on Base
- Users deposit USDC and receive vault shares
- Initial conservative strategy: Aave V3 USDC
- NAV, share price, reserves, and redemptions remain visible on-chain
- Base yield does not depend on token price, lock mechanics, or off-chain bookkeeping.

Commitment Layer

- Users lock vault shares, not raw assets
- Lock duration makes user intent legible
- Rewards and access rights are built above the vault, not inside the yield engine
- Early exits can be handled by rules instead of discretion
- Future governance can inherit the same commitment signal.

Capital stays transparent. Long-term behavior becomes programmable.

THE SYSTEM

A vault-based system with commitment built on top.

USDC flows through one ERC-4626 accounting system. Commitment is expressed by locking vault shares, not by mixing incentives into the yield engine.

CORE CAPITAL FLOW

COMMITMENT LAYER ABOVE THE VAULT

Vault shares can be time-locked
Locking creates explicit on-chain commitment states without moving users into a separate accounting system.

Commitment can be read by product logic
Rewards, access rights, future governance, and early-exit rules can sit above the vault.

Redemptions remain policy-bound
Routine exits use reserves. Stress exits follow a defined Emergency Exit path.

CURRENT LIVE SCOPE

BASE MAINNET · AAVE V3 USDC · SINGLE SHARE-PRICE ACCOUNTING · TIME-LOCKED COMMITMENT · DEFINED EMERGENCY EXIT PATH

KEY MECHANISM

Credible exit comes first.

Long-term alignment only works when users can commit without feeling trapped. YearRing separates commitment signals from principal punishment.

01 Lock creates a clear signal

Users time-lock vault shares, making long-term intent visible on-chain rather than self-reported.

02 Penalties stay above principal

Early-exit penalties sit in the reward and access layer — not directly on deposited capital.

03 Exit remains credible

Reserve policy and Emergency Exit paths are built so commitment does not become trapped capital under stress.

04 Commitment becomes a choice

Users can commit for better alignment and future access, while still trusting that the exit path is rule-based and visible.

The goal is durable capital behavior, not captive capital.

THE EXPANSION

From patient users to future RWA access.

YearRing starts with conservative DeFi yield, but the deeper opportunity is turning long-term on-chain users into a structured capital base for real-world asset issuers.

FOR USERS

DeFi gives access, but not patience.
Most products still encourage short-term rotation.
YearRing gives users a structure to stay invested longer through transparent accounting, rule-based exits, and commitment rewards above the vault.

FOR RWA ISSUERS

RWA supply is growing, but retail distribution remains inefficient.
Issuers need pooled, legible, patient capital — not fragmented wallet demand.

YearRing connects both sides

A capital coordination layer for long-term on-chain users and future RWA strategies.

Not another yield frontend.

- Lock-up rewards and early-exit rules extend user holding behavior
 - Pooled deposits convert fragmented retail demand into usable capital
 - Transparent vault accounting makes the capital base easier to monitor.
 - Over time, YearRing can become a compliant access layer for future RWA strategies.
-

Long-term capital becomes usable capital.

CURRENT STATE

Already live, deliberately narrow.

YearRing is not a concept deck. The protocol is live on Base with a conservative first strategy, while user access remains intentionally limited before audit and broader rollout.

CURRENT PROOF OF EXECUTION

01 Live on Base mainnet

Core contracts are deployed on Base, with public entry points through the website, app, GitHub, and official email.

02 Conservative strategy loop verified

The first strategy is Aave V3 USDC on Base, chosen for a narrow, understandable initial risk surface.

03 Core protocol logic implemented

Vault accounting, reserve policy, access control, Emergency Exit path, and commitment logic are implemented with an internal test suite.

04 Narrow rollout by design

Access remains allowlist-first while formal audit preparation and broader user onboarding are being prepared.

Verification

App: app.yearringfund.com

GitHub: [yearring-fund / yearring-protocol](https://github.com/yearring-fund/yearring-protocol)

Audit: internal test suite completed, formal audit pending

Rollout: allowlist-only before audit

LIVE ON BASE · AAVE V3 USDC · MAINNET CONTRACTS · DEPLOYED CONTRACTS TESTED · ALLOWLIST-FIRST ROLLOUT

WHY NOW

Why now, why Outlier Ventures.

Stablecoins are becoming regulated payment and settlement rails, while RWAs are bringing credible asset exposure on-chain. What is still missing is a transparent user-side capital container that helps people allocate, stay invested, and manage exits. YearRing is already live as a narrow protocol primitive; OV can help turn it into a fundable, compliant, scalable capital protocol.

THE GAP YEARRING FILLS

From stable-value rails to long-term capital.

Market timing: stablecoins create the settlement rails, RWAs create the asset supply, and YearRing builds the user-side capital container between them.

For users
RWAs bring better assets on-chain, but users still need a clear path to allocate, exit, and stay invested.

For RWA issuers
Retail demand is fragmented. Issuers need pooled, legible, patient capital.

YearRing connects both
A transparent, non-custodial capital container for long-term users and future RWA strategies.

WHAT OUTLIER UNLOCKS

From live primitive to fundable protocol.

- Token design that rewards commitment without distorting base yield.
- Structured access to tokenized real-world yield, subject to legal and partner requirements
- RWA / DeFi partner paths for the first scalable strategy.
- Pilot design, user metrics, and GTM discipline.
- Fundraising narrative and access to the right capital network.

Founder & Current Ask

Lugang Si

Founder, YearRing Fund Protocol. YearRing is currently founder-led, with the core protocol, product narrative, and first Base deployment already built.

Current ask: token design, legal/RWA structure, pilot architecture, partner access, and fundraising narrative.

From stable-value rails to long-term capital.
